Species: *Avicennia marina*

White mangrove is a small tree with extensive root system with 'pencil roots' (breathing roots). The leaves are able to excrete excess salt through pores; consequently salt crystals are frequently present on the leaves. *Avicennia marina* is found in the coasts of the Indian Ocean, its habitat is sandy shores, estuaries and mud banks. *Avicennia marina* is a multipurpose tree; it is used in traditional medicine, for preventing coastal erosion and as a source of tannin. It is threatened by the loss of mangrove habitat throughout its range, primarily due to extraction and coastal development, and there has been an estimated 21% decline in mangrove area within this species range since 1980.

Tree(s) planted in Project Eden Projects, Madagascar

In response to the large-scale loss of mangroves and upland forests in Madagascar, Eden Reforestation Projects initiated the Madagascar Reforestation Project. The program began in 2007 and since its inception, Eden has successfully planted over 407 million mangrove and dry deciduous trees in northwest Madagascar.
